(a) the error is in the occupied bins
exact zeros where the reference is zero
reference shape in the bins where it is nonzero
null: zeroing the same number of randomly chosen cells
(b) cost does not localise the error
cheap third
middle third
expensive third of the grid
null: reference shape in a randomly chosen third of bins
−200
−100
0
100
recovered share of the closure's error gap (%)
