

When do reference physical inputs help a learned solubility model?

a The pipeline, and the paradox

Either the fixed model is wrong, or the learned profile carries information the reference does not.

b Where the error sits

error on the UD reference profiles ($n = 477$)

fifty-nine strata; fifteen boundable (filled), one stands (*)

the three boundable solvent classes

water †

aprotic acceptors ‡

the inputs, at most the model, at least

The input bound hardly moves; the error moves 25-fold.

* stands: bounded, sign-stable under deletion, margin positive.

† measured, not established: dropping a laboratory flips the sign.

‡ measured, not established: margin not positive, bound one-sided.
