

When do reference physical inputs help a learned solubility model?

a The pipeline, and the paradox

Either the fixed model is wrong, or the learned profile carries information the reference does not.

b Where the error sits

59 strata, UD reference profiles ($n = 477$), $(\ln \gamma)^2$

44 with no bound 15 boundable, 1 stands *

the inputs, at most the model, at least

glycol ethers * stands: bounded, stable, positive

water † not established

aprotic acceptors ‡ not established

0 0.5 1.0 1.5 2.0

The input bound moves 2-fold; the error, 25-fold.
