

When do reference physical inputs help a learned solubility model?

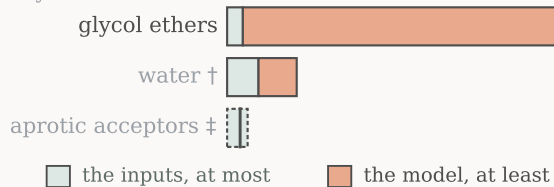

a The pipeline, and the paradox

Either the fixed model is wrong, or the learned profile carries information the reference does not.

b Where the error sits

error on the UD reference profiles ($n = 477$),
by solvent class

The input bound hardly moves; the error moves 25-fold.

† measured, not established: the ordering here does not survive removing one contributing laboratory. ‡ measured, not established: this margin is not positive, and the bound is one-sided.
